--comprising: a fan for generating a given air stream;

an evaporator positioned downstream of the fan and through which the given air stream flows;

a distributor space positioned downstream of the evaporator; control flaps between a first flow passage and a second flow passage, wherein the given air stream is configured to be divided by the control flaps such that generation of a first partial air stream and a second partial air stream is possible,

a mixing chamber, wherein the first flow passage leads into the mixing chamber;

a heat exchanger positioned in the second flow passage for heating the second partial air stream, wherein the second flow passage opens out in the mixing chamber downstream of the heat exchanger, wherein generation of a mixed air stream from the first and second partial air streams in the mixing chamber is possible;

air exit passages leading from the mixing chamber into different regions of the vehicle's interior, wherein each air exit passage is assigned with a switching flap on a mixing chamber side for directing an air exit stream from the mixing chamber through the associated air exit passage, wherein at least one of the air exit passages is a defrosting passage used to generate a defrost air stream directly on an inner side of a vehicle window and emerges at a defrosting nozzle assigned to the vehicle window;

at least one bypass passage through which a warm air stream can flow, wherein the at least one bypass passage branches off downstream of the heat exchanger, starting from the second flow passage upstream of the mixing chamber, and leads directly into the defrosting passage; and

a mixing flap assigned to the at least one bypass passage for directing the warm air stream through the bypass passage, wherein the mixing flap and control flaps are arranged axially on a common pivot axle,

wherein the mixing flap is axially spaced apart from the control flaps in relation to the common pivot axle and the mixing flap and control flaps are curved in cross section,
